Working Session

Duniya ka tention lena band kardo...
Apni jindagi sawar lo mast..

Roots se connected rehna is most important...
Jaha se start kia hai vo hmesha yaad rakhna hai..

No recording for working sessions

Revision from Scratch from Linux will start from December...

Public with Service Endpoint

Har subnet ke lie enable krna pdta hai..

Domain Name = whitehouse.com (Ghar ka naam)

IP address -> 20500 , Washington DC,USA (Ghar ka asli pata)

DNS Server

Domain Name -> IP Address dhhondh kar deta hai..

DNS Record

Naam aur pate ki mapping

Jaise hi whitehouse.com par hit marta hai, browser DNS se IP leta hai aur IP khol dalta hai..

DNS **Azure DNS Zone - DNS Record ko manage krne wala jagah..** DNS

Domain kharid ne ke lie registrar ke paas jana pdta hai.. like hostinger

Azure me DNS zone banao...

Zone Name: tumkonho.com

Jaise hi DNS Zone banega, azure DNS zone ke lie authoritative name server dega...

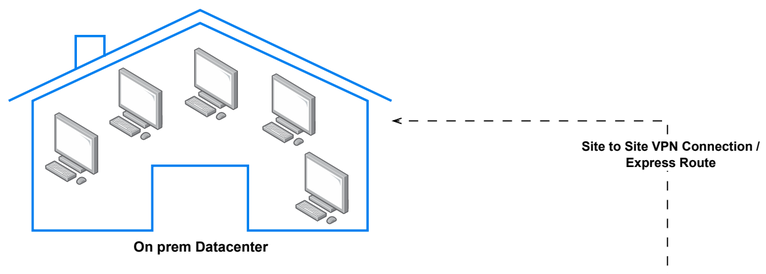

Registrar me NS change krdo...

Azure DNS me A Record banaenge...

pehle field me aaega www -> type = A record and map with IP address..

www.tumkonho.com

Apne laptop se DNS test kaise kare? nslookup www.tumkonho.com

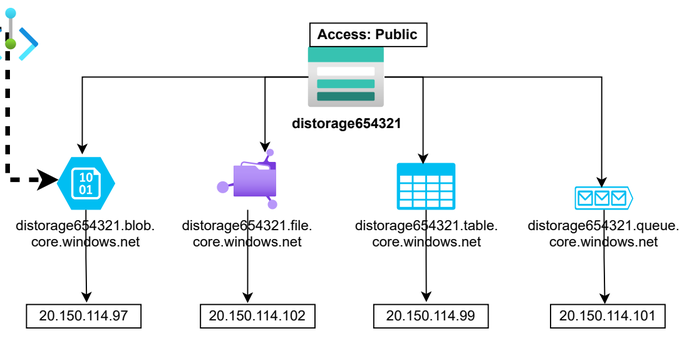

DNS 2 prakar ke hote hai?

Public DNS | **Private DNS**

Azure Private DNS + Private Endpoint

www.tumkonho.com — **Public** — 56.54.54.12

Problems

Bhale hi sirf subnet se access hoga lekin subnet ke andar se access public ip ke through hi ho raha hai..

Jis subnet se service endpoint banake firewall me enable kara sirf vohi subnet se access ho skta hai.. baki kisi subnet se access krna impossible hai..

Private endpoint ek aisa vyastha hai jiski madad se hum azure ki kisi service SQL, KV, Storage ko apne virtual network se private IP access ke jariye access kar skte hai..

Ek Vnet ke andar, Subnet dalke, VM banaya...

Ek Storage account banae

Is VM se Storage account private tarike se access karna..

Isko karne ke lie Private endpoint use krna pdega..

Private Endpoint jab banaenge to private Endpoint pr ek private IP aaega... Is IP ko attach karne ke lie ek network Interface aur NIC kisi network se connect hoga...

Ek Alg vnet bana dia aur usme ek alg subnet bana dia private-endpoint subnet naam se

Dono ko Vnet Peering kar dia..

Hub Vnet ke details use karke private endpoint bana ke storage account ko jod dia..

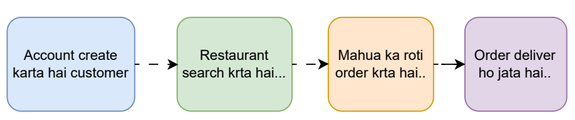

Private Endpoint ban ne ke baad azure uske NIC ko ek private IP address dega..

Ab yah private IP storage account ki blob service tk pahuchne ka rasta bataega..
Note: Ye storage account ki apni IP nahi balki private endpoint ki IP hai..

Only for Teju Bhaiya jiske andar me hai curiosity

Manlo ek IT company khol lia ek bhakua dost ke saath 5 saal baad..

Automation Plan

1. Central Monitoring System Setup Azure Monitor / Prometheus + Grafana + Loki etc..
2. Alert ko event grid me dal dia..
3. Processing karne ke lie workflow banaya
4. Logic app se ek service now ticket raise krwa dia..
5. Ab ticket pr approval aaya..
6. Azure function se analysis karke root cause dekh ke ye jo bhi tha self ka pura process ko solve kar dia..
7. Ticket Close ho gya..

Azure AI Chatbots + MCP use karke bhi workflow bana sakte..

Order hi place nahi ho raha hai...

500 error aa raha hai...

P1 Incident

Home Work: Ye automation plan me dimag lgana hai...
